

## When Was The Last Time You Had Your Heat Pump Cleaned Properly?

As you were told by our trained Technicians when they installed your Heat Pump, you should personally clean the filters in your Heat Pump at least once a month to get rid of the dust and dirt that covers the indoor unit filters. We're sure you are following their suggestion, but be aware that cleaning your filters is just "basic maintenance".

After regular usage the whole head unit also needs to be "correctly" cleaned and serviced.

Why should I schedule Thomas Edison Electric to come into my home to fully clean my Heat Pump? There are three good reasons.

1. **SAVE ON YOUR POWER BILL:** Cleaning your Heat Pump can save you up to 30% power usage for that unit. When dirty, a unit has to work harder to cool or heat the air because it is effectively choking, as it tries to draw air through it to be cooled or warmed. The harder the unit has to work to get the desired results, the more power it uses.
2. **MICROBIAL CONTAMINATION:** All regular used Heat Pumps become infected with "microbial contamination" which include fungi, mold, human and animal DNA and bacteria. Heat Pumps are the perfect environment for such contaminants, and of course become airborne which is bad news for Asthma and allergy sufferers, children and the sick. A Heat Pump cleaning from Thomas Edison Electric virtually eradicates microbial contamination so you can breath healthy air again.
3. **YOUR HEAT PUMP WILL LAST LONGER:** A regular serviced Heat Pump will last a lot longer than one that never gets serviced. If you purchase a new car and never service it, you would easily shorten its life expectancy by up to 75%. Your Heat Pump is no different.

Don't hesitate any longer! Contact Thomas Edison Electric today to schedule your full Heat Pump cleaning. It's a decision you will never regret.
